

Automotive Electrical Systems

Batteries, Charging and Starting Systems

Donald Jones
Brookhaven College

Automotive Electrical Systems

Battery Operation

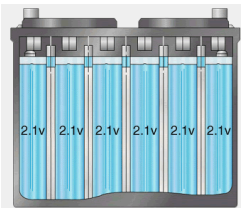

- Batteries convert chemical energy into electrical energy
- During discharge the battery's plate composition is changed
- During charging the alternator returns the battery plates to their original composition

Automotive Electrical Systems

Battery Construction

- Positive plates**
 - Lead peroxide - PbO_2
- Negative plates**
 - Sponge lead - Pb
- Electrolyte**
 - 36% sulfuric acid - H_2SO_4
 - 64% water - H_2O
- Cells are connected in series

Automotive Electrical Systems

Battery State Of Charge

Specific Gravity	State of Charge	Battery Voltage
1.265	100%	12.65 volts
1.235	75%	12.4 volts
1.200	50%	12.2 volts
1.165	25%	12.0 volts
1.135	Discharged	11.7 volts

Automotive Electrical Systems

Battery Rating Systems

- Cold-Cranking Amps**
 - number of amps a battery can deliver for 30 seconds at 0° F without the cell voltage falling below 1.2 volts
- Cranking Amps**
 - number of amps a battery can deliver for 30 seconds at 32° F without the cell voltage falling below 1.2 volts
- Reserve Capacity**
 - Length of time a fully charged battery can deliver 25 amps at 80° F
- Ampere-Hour Rating**
 - current the battery can deliver for for 20 hours without the cell voltage dropping below 1.75 volts at 80° F

Automotive Electrical Systems

Battery Load Test

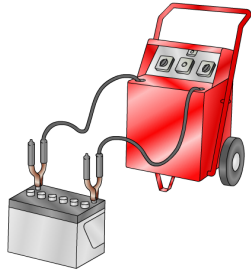

- Open Terminal Voltage above 12.4 volts
- Load test the battery for 15 seconds at:
 - ½ the cold cranking amp rating
- The battery's voltage should not fall below 9.6 volts

Automotive Electrical Systems

Three Minute Charge Test

- Charge the battery at a rate of 30 to 40 amps for three minutes
- If the terminal voltage remains below 15.5 volts charge the battery and re-conduct the load test
- If the terminal voltage exceeds 15.5 volts the battery should be replaced

Automotive Electrical Systems

Battery Diagnosis

```

    graph TD
      A[Visual Inspection  
Check Open Terminal Voltage] --> B[Above 12.4 Volts]
      A --> C[Below 12.4 Volts]
      B --> D[Conduct Load Test]
      C --> E[Conduct Three Minute Charge Test]
      D --> F[Below 9.0 Volts  
Replace Battery]
      D --> G[Above 9.5 Volts  
Battery OK]
      E --> H[Above 15.5 Volts  
Replace Battery]
      E --> I[Below 15.5 Volts  
Charge Battery and Load Test]
    
```

Automotive Electrical Systems

Parasitic Draw

- A parasitic draw discharges the battery while the vehicle is parked
- Common causes of excessive parasitic draw include malfunctioning hood, trunk, glove box and courtesy lamp circuits
- Parasitic draw is diagnosed by monitoring current flow from the battery with the ignition and all non-ignition switched circuits turned off
- A maximum of 50 mA of current flow is a common parasitic draw specification

Automotive Electrical Systems

Charging System

- Alternator
- Drive belt
- Voltage regulator
- Indicator lamp or gauge
- Battery
- Wiring and circuit protection

Automotive Electrical Systems

Charging System Operation

- Alternators use magnetic induction to produce AC voltage
- Diodes convert the AC voltage into DC voltage
- The voltage regulator controls alternator output by regulating the field current

Automotive Electrical Systems

Alternator Components

- Rotor & brushes
- Stator
- Diode rectifier
- Voltage regulator
- Generator housing

Automotive Electrical Systems

Alternator Circuits

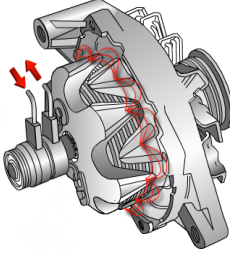

- **B+ Output**
 - connection to battery and vehicle electrical system for alternator output
- **I Circuit**
 - ignition circuit
 - used to turn on the voltage regulator
 - Powered when the ignition switch is in the run position
- **A Circuit**
 - provides power for rotor
 - current flow controlled by voltage regulator
- **S Circuit**
 - stator circuit
 - ½ alternator output to voltage regulator

Automotive Electrical Systems

Rotor Operation

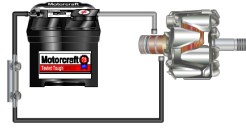

- The rotor is the electromagnet rotated to induce a voltage output in the alternator's stator windings
 - Brushes
 - Slip rings
 - Field windings
 - Pole pieces

Automotive Electrical Systems

Voltage Regulator Operation

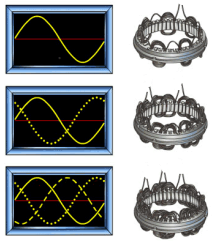

- The voltage regulator monitors stator output on the S circuit and controls alternator output by modulating the rotor's field current flow through the A circuit
- The rotor's current flow may be regulated on the power or ground side

Automotive Electrical Systems

Stator Operation

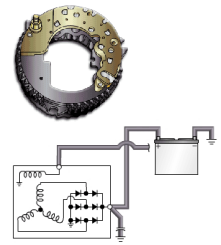

- The rotor induces an AC voltage output from the stator
- The stator's output is controlled by varying the strength of the rotor's magnetic field
- Diodes are used to rectify the stator's AC output into DC voltage

Automotive Electrical Systems

Rectifier Operation

- The rectifier bridge uses diodes to convert the AC sine waves generated by each set of stator windings into phased DC voltage output

Automotive Electrical Systems

Charging System Inspection

- **Undercharging**
 - dead battery, slow cranking, indicator lamp on
- **Overcharging**
 - battery boiling, high voltage, excessive bulb failures, indicator lamp on
- Check battery condition
- Check belt tension
- Check wiring, connections and grounds
- Check alternator input terminals for proper signals

Automotive Electrical Systems

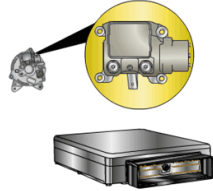

Check Alternator Operation

- Hook up VAT 40/60 or equivalent to monitor alternator output and battery voltage
- Check alternator's output and battery voltage at idle and 2000 RPM with all electrical loads turned off
- Check the alternator's output and battery voltage at idle and 2000 RPM with approximately a 40 amp electrical load applied
- Check the alternator for maximum rated current output by applying a load with the VAT 40/60 or equivalent while operating the engine at 2000 RPM
- Compare the readings to vehicle specifications

Automotive Electrical Systems

Isolating Charging Concerns

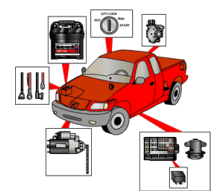

- Some vehicles allow full or increased battery power to be applied to the field
 - if the alternator is defective there will be no change in alternator output
 - If output increases the field control system is at fault

Automotive Electrical Systems

Starting System Components

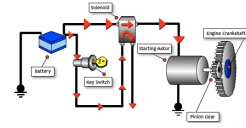

- Starter
- Battery
- Cables and Wires
- Ignition switch
- Starter relay
- Starter solenoid
- Manual Lever Position (MLP) switch
- Starter Clutch Pedal Position (SCPP) switch

Automotive Electrical Systems

Starting System Operation

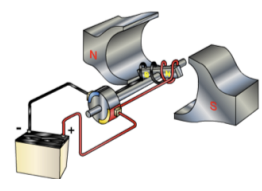

- The battery provides power to the ignition switch and starter relay
- Closing the ignition switch provides power through the neutral or clutch safety switch to the starter relay
 - MLP versus CES
- The starter relay energizes the starter solenoid and motor

Automotive Electrical Systems

Motor Operation

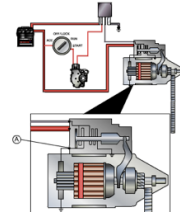

- The magnetic pole in the armature is attracted and rotates toward the opposite magnetic pole of the field
- The commutator rotates with the armature reversing the armature's current flow/magnetic field and the like magnetic poles now move the armature away from the field

Automotive Electrical Systems

Solenoid Actuated Starter

- The battery provides power to the ignition switch and starter relay
- Closing the ignition switch provides power through the MLP to the starter relay
- The starter relay delivers power to the starter solenoid
- The solenoid moves the starter drive into position and energizes the starter motor

Automotive Electrical Systems

Moveable Pole Shoe Starter

- The moveable pole shoe starting system uses a fender mounted relay to send current to the starter motor
- A moveable pole shoe is used to engage the starter drive with the flywheel and complete the circuit allowing current to flow to the field coils and armature

Automotive Electrical Systems

Starter Motor

- Armature
- Field coils or field magnets
- Brushes
- Solenoid
- Drive assembly
- Frame or housing

A - Starter Drive
B - Flywheel
C - Pinion Gear

Automotive Electrical Systems

Starter Drive Gear

- The starter drive has an overrunning clutch that engages the pinion gear with the flywheel as the starter motor turns
- The overrunning clutch freewheels when the engine takes over and protects the starter motor from damage

Automotive Electrical Systems

Starter Draw and Performance Test

- Connect an inductive ammeter to measure current flow from battery during cranking
- Connect a tachometer to measure cranking speed
- Disable the fuel injection system and ignition system
- Crank the engine for 15 seconds and monitor current flow and engine cranking speed
- Listen for any abnormal sounds during engagement operation and disengagement
- Compare your results to the vehicle's specifications

Automotive Electrical Systems

Engine Does Not Crank

- Loose or corroded battery cable connections
- Undercharged battery
- Malfunctioning starter motor
- Malfunctioning ignition switch
- Malfunctioning starter relay or solenoid
- Malfunctioning transmission or clutch safety switch

Automotive Electrical Systems

Engine Cranks Slowly

- Loose or corroded battery cable connections
- Undercharged battery
- Loose or corroded starter motor connections
- Malfunctioning starter motor
- Excessive engine rotational force required

 Automotive Electrical Systems

Unusual Starter Noise

- Starter motor improperly mounted
- Malfunctioning starter motor
- Damaged flywheel teeth and or starter drive
